

CrS Report for Congress: Balancing Scientific Publication and National Security Concerns: Issues for Congress: February 2, 2004 - RL31695

The federal government has historically supported the open publication of federally funded research results. In cases where such results presented a challenge to national security concerns, several mechanisms have been employed. For fundamental research results, the federal policy has been to use classification to limit dissemination. For advanced technology and technological information, a combination of classification and export and arms trafficking regulation has been used to inhibit its spread. The terrorist attacks of 2001 have increased scrutiny of nonconventional weapons, including weapons of mass destruction, and a series of research publications, including results showing that polio virus could be artificially created, have increased concerns over whether publication of federally funded extramural research results could threaten national security. The current federal policy, as described in National Security Decision Directive 189, is that fundamental research should remain unrestricted and that in the rare case where it is necessary to restrict such information, classification is the appropriate vehicle to do so. Other mechanisms restrict international information flow, where Export Administration Regulations (EAR) and International Traffic in Arms Regulations (ITAR) control export of items and technical information on specific lists. Both EAR and ITAR contain a fundamental research exclusion, but this exclusion is lost ...
